NPG REPORT NO. 770

Ballistic Test of Cool Propellants

PART A

SYNOPSIS

1. This is the tenth partial report on Task Assignment NPG-15-Re2d-64-1, the "Development of a Cool Propellant for the 3"/50 Caliber Gun", the sixteenth partial report on Task Assignment NPG-14-Re2d-62-1, the "Development of a Cool Propellant for the 3"/70 Caliber Gun", the third partial report on Task Assignment NPG-13-Re2a-184-3, the "Development of Ignition Systems for "Cool" Propellant Charges", and the final report on "Ballistic Test of Cool Propellants Ex-6735, Ex-6721, and IHPB-S-83C.
2. From the results of the subject tests, it is concluded that:
 - a. Ex-6721 was too fast for the 3"/70 large chamber gun and too slow for use in the 3"/50 caliber gun.
 - b. Ex-6735 was ballistically suitable for use in the 3"/50 caliber gun with the XC-D22/250 primer. The pressure-time records obtained with the Mk 42 primer plus 2 empty pyralin containers were fairly smooth while those obtained with all other ignition systems had slight steps in the pressure-rise section of the curves.
 - c. IHPB-S-83C with the XC-D22/250 primer was too slow for use in the 3"/50 caliber gun but was ballistically satisfactory with the Mk 42 primer. The pressure-time curve obtained with IHPB-S-83C and the XC-D22/250 primer had a slight step in the pressure-rise section but was much better than the ones obtained with IHPB-S-83C using the Mk 42 primer and with NFFB-223 using the XC-D22/250 primer. No carbon deposits were obtained with IHPB-S-83C.
 - d. Ex-6735 with the XC-D22/250 primer gave as much or more black smoke than the other non-picrite powders at service charge with the exception of Ex-6721 which produced slightly denser smoke.

CONFIDENTIAL

CONFIDENTIAL

NPG REPORT NO. 770

Ballistic Test of Cool Propellants

e. The smoke was similar in appearance (i.e. black) for both single and double-base cool non-picrite (DBP) propellants on flashless rounds, with the exception of IX-29 (single-base) and IX-31 and IX-32 (double-base) which gave dark grey smoke. Flashing rounds in general produced brownish smoke although low intensity flashes were frequently accompanied by brown and black or brown and grey smoke.

f. A relationship exists between the amount of black smoke produced and the ignition systems used with cool non-picrite (DBP) powders and is dependent on the occurrence or non-occurrence of flash. Carbon deposition was only slightly affected by changes in ignition.

g. There is no apparent correlation between the appearance of black smoke and carbon deposits produced with non-picrite propellants and ballistic regularity or the smoothness of the pressure-time curves.

h. The extent of carbon deposition, while not serious enough to cause mechanical difficulties in a few rounds of slow gun firings, is greatly aggravated during extended rapid fire conditions. It is evident that the carbon deposits causing gun operating failure are not due to a few unusual rounds but to a cumulative effect.

3. BACKGROUND:

References (a), (b), and (c) set up the general tasks for the development of cool powders for the 3"/50 and 3"/70 caliber guns and the development of ignition systems for cool propellant charges respectively. Reference (d) requested that Ex-6735 be fired for ballistic assessment in the 3"/50 caliber gun and described it as a cool, single-base non-picrite propellant, with a calculated flame temperature of 1883°K. Reference (e) requested that the Naval Proving Ground investigate the occurrence of carbon deposits and black smoke, which was observed during rapid fire erosion studies of Ex-6735 in the 3"/50 caliber gun, and compare the amount and frequency of the carbon deposits and black smoke to that obtained with other non-picrite (single and double-base) powders. Reference (f) requested that Ex-6721 be fired for assessment in the 3"/70 caliber gun and described it as a single-base non-picrite propellant containing 1% lead carbonate with a calculated flame temperature of 1876°K. Reference (g) requested that IHBP sample 83C be fired for ballistic assessment and observance of carbon deposit in 3" guns and described it as a cool single-base powder, without dinitrotoluene or dibutylphthalate,

CONFIDENTIAL

CONFIDENTIAL

NPG REPORT NO. 770

Ballistic Test of Cooi Propellants

with a calculated flame temperature of 2123°K. Reference (h) requested that the Proving Ground conduct ignition and ballistic research on cool propellants as necessary to develop optimum ignition systems for various guns. References (i), (j) and (k) are reports on previous tests conducted with cool non-picrite powders.

4. OBJECT OF TEST:

- a. To determine whether Ex-6735 is ballistically suitable for use in the 3"/50 caliber gun.
- b. To investigate the carbon deposits resulting from firing of cool, non-picrite propellants in 3" guns.
- c. To determine whether Ex-6721 is ballistically suitable for use in the 3"/70 caliber gun.
- d. To determine whether IHPB-S-83C is ballistically suitable for use in the 3"/70 or 3"/50 caliber guns and to note the extent and nature of any carbon deposits.
- e. To establish a suitable ignition system for various cool powders.

5. PERIOD OF TEST:

PART CDETAILS OF TEST

6. DESCRIPTION OF ITEMS UNDER TEST:

Reference (1) gave in detail the powder description and closed bomb data. A summary of the data follows:

<u>Actual Composition</u>	<u>Ex-6721</u>	<u>Ex-6735</u>	<u>IHPB-S-83C</u>
Nitrocellulose (*)	75.07%	74.72%	88.52%
Dinitrotoluene	12.80	13.01	--
Dibutylphthalate	11.08	11.27	--
Diphenylamine	1.05	1.00	--
Lead Carbonate (added)	0.76	--	--
Ethyl Centralite	--	--	7.00
Total Volatiles	0.76	0.42	4.48

* Ex-6721 and Ex-6735 = (13.20%N)
IHPB-S-83C = (12.61%N)

Reference (1) also gave the following information:

<u>Sample</u>	<u>Flame Temp. °K</u>	<u>Grain Dimensions</u>				<u>RQ (%)</u>	<u>RF (%)</u>
		<u>Length (in.)</u>	<u>Diam. (in.)</u>	<u>Ave. Web (in.)</u>	<u>No. of Perfs.</u>		
Ex-6721	1876	0.486	0.1852	0.0327	7	117.1(a)	98.1(a)
Ex-6735	1883	0.4300	0.1595	0.0275	7	105.5(b)	101.3(b)
IHPB-S-83C	2123	0.476	0.186	0.029	7	76.2(c)	89.8(c)

- (a) Based on Ex-6688 as 100% at 90°F
- (b) Based on Ex-6722 as 100% at 90°F
- (c) Based on NPFB-223 as 100% at 90°F

References (1), (j) and (k) gave similar information regarding other non-picrite powders used in the subject tests.

CONFIDENTIAL

CONFIDENTIAL

NPG REPORT NO. 770

Ballistic Test of Cool Propellants

7. PROCEDURE:

a. Ex-6721 and IHPB-S-83C were fired in the 3"/70 and 3"/50 caliber guns. Ex-6735 was fired in the 3"/50 caliber gun. Muzzle velocities, maximum pressures (copper crusher) ejection times, visual observations and photographs of smoke, flash and carbon deposits were obtained. Pressure-time records were obtained at 90°F with various ignition systems. All charges were assembled at PPD (Production Packing Depth).

b. Rapid fire tests were conducted with Ex-6735 in a 3"/50 caliber Mk 22-4 gun by firing up to 175 rounds per program in 25-round bursts with a 20 second delay between each burst. These tests were conducted under a task relative to gun life determinations. Results of gun wear will be covered by separate reports.

c. Tests were conducted to determine whether VT fuze performance would be satisfactory with the ignition system and charge assembly selected for the rapid fire wear trials.

d. In order to insure against obtaining hangfires or misfires during the scheduled rapid fire wear trials with Ex-6735, tests were conducted with Ex-6722, the pilot lot for Ex-6735, to determine the maximum black powder content of the XC-D22/ primer which would still give relatively smooth pressure-time curves.

8. RESULTS AND DISCUSSION:

The results of the subject tests are given in detail in the Appendices and are summarized below:

a. Uniformity:

(1)	Gun:	3"/50 Caliber, Mk 21-0
	No.:	8917, 7403, 7396 (New)
	No.:	7575, 7643, 12811, 16519 (Worn)
	Projectile:	Mk 33-1(13.00 lbs.) Epsom Salt loaded
	Cartridge Case:	Mk 7, Brass, Rubber Crimped
	Lead Foil:	30 grams per round on SPCG-10135 None with Ex-6721
	Wad and Spacer:	45 grams per round on all others Cardboard, NGF-Dwg. No. 132664 Pcs. Nos. 13 and 4
	Powder Temp.:	84°F on 15 January 1951 90°F on all others

 Powder F - 60/40 blend of NPFB-266 (2.41 lbs.) and Ex-6735 (1.96 lbs.)
 Powder G - 70/30 blend of NPFB-266 (2.91 lbs.) and Ex-6735 (1.47 lbs.)
 Powder H - 80/20 blend of NPFB-266 (3.22 lbs.) and Ex-6735 (0.98 lbs.)
 Powder I - 90/10 blend of NPFB-266 (3.62 lbs.) and Ex-6735 (0.49 lbs.)

The percentage values indicated for the above blends are only approximates for the charges fired. They do, however, represent accurately the portion of the respective full charge weight of each component powder considered separately.

- (a) Plus 2 empty pyralin containers and an end around primer.
- (b) Plus 150 grams of NPD-223 in pyralin container around forward end of primer.
- (c) Based on 2 rounds.
- (d) Based on 3 rounds.
- (e) Based on 4 rounds.

NPG REPORT NO. 770

Ballistic Test of Cool Propellants

(2) Velocity and pressure uniformity was satisfactory for all groups.

b. Charge Determination:

(1) 3"/50 Caliber Gun

Firing conditions are the same as for Uniformity Firings.

Powder	Gun	Primer	Vel. (f/s)	Charge (lbs.)	Pressure (t.s.i.)
Ex-6721	8917 (New)	Mk 42 (c)	2700	5.47 (a)	14.6 (a)
Ex-6721	8917 (New)	XC-D22/195	2700	5.58 (a)	14.3 (a)
Ex-6721	8917 (New)	Mk 42	2700	5.43 (a)	14.9 (a)
Ex-6735	8917 (New)	XC-D22/250	2700	4.91 (a)	14.7 (a)
Ex-6735	7403 (New)	XC-D22a/250	2700	4.88 (a)	14.9 (a)
Ex-6735	7396 (New)	XC-D22a/250	2700	4.86 (a)	15.2 (a)
Ex-6735	7575 (Worn)	XC-D22/250	2700	4.90 (a)	15.2 (a)
Ex-6735	7643 (Worn)	XC-D22a/250	2700	4.91 (a)	14.9 (a)
Ex-6735	12811 (Worn)	XC-D22/250	2700	4.85 (a)	15.2 (a)
Ex-6735	(Average of New and Worn Guns)		2700	4.89 (a)	15.0 (a)
IHBP-S-83C	8917 (New)	Mk 42	2700	4.83 (b)	15.5 (b)
IHBP-S-83C	8917 (New)	XC-D22/250	2700	4.91 (b)	14.8 (b)

(a) Determined by Matched Powder Method. Matched against SPCG-10135 (4.19 lbs., Primer Mk 42).

(b) Determined by New Gun Method.

(c) Plus 2 empty pyralin containers end on end around primer.

(2) Ex-6721 was too fast for the 3"/70 caliber gun. A charge of 9.00 lbs. gave a pressure of 22.3 tsi and only 3271 f/s velocity. It was too slow for use in the 3"/50 caliber gun regardless of ignition used.

(3) Ex-6735 with the XC-D22/250 primer was ballistically suitable for use in the 3"/50 caliber gun, Mk 21-0. The average of six firings just met the lower pressure limit of 15.0 tsi.

(4) IHBP-Sample 83C with the XC-D22/250 primer was too slow for use in the 3"/50 caliber gun, but was ballistically satisfactory with the Mk 42 primer. It was too fast for the 3"/70 caliber gun, giving only 3347 f/s at a pressure 23.3 tsi with a charge of 8.50 lbs.

(C) (D)

CONFIDENTIAL

NPG REPORT NO. 770

Ballistic Test of Cool Propellants

c. Pressure-time Records:

(1) The pressure-time records obtained in the subject tests are presented in Appendix (B).

(2) Ex-6722 gave smooth curves with the XC-D22/200 and XC-D22/250 primers while the curves with the XC-D22/300 primer had slight steps in the pressure-rise portion. The XC-D22/250 primer appeared to be the best primer from the standpoint of both smoothness of pressure-time curves and insurance against hangfires.

(3) The pressure-time curves obtained with Ex-6735 using the Mk 42 primer plus 2 empty containers were fairly smooth but were not as good as those for Ex-6722 with the same ignition system. Ex-6735 with all other ignition systems gave slight steps in the pressure-rise section of the curves and were worse than those for Ex-6722 under the same conditions.

(4) Ex-6735 with a scavenger NH powder at the base of the case and the XC-D22/250 primer gave curves with steps. However, the velocity-pressure relationship, velocity and pressure uniformity and fuze performance were satisfactory with this assembly.

(5) In general, the curves obtained with Ex-6735 were worse than those obtained with Ex-6722 for all ignition systems tested. Since compositional differences are slight this may possibly be attributable to the smaller perforation diameter of Ex-6735 relative to other grain dimensions.

(6) The pressure-time curve obtained with IHBP-S-83C with the XC-D22/250 had a slight step in the pressure-rise section but was much better than the ones produced by IHBP-S-83C with the Mk 42 primer, and by NPFB-223 with the XC-D22/250 primer.

d. Smoke and Flash:

(1) Appendix (D) gives a summary of the composition and smoke data for various powders. A breakdown as to ignition along with the resulting smoke, flash, and carbon data are tabulated in Appendices (D) and (E). Appendix (F) contains photographs of smoke and flash.

(2) Ex-6735 with the XC-D22/250 primer gave as much black smoke as, or more than, the other non-picrite powders tested at service charge, with the exception of Ex-6721 which produced slightly denser smoke.

CONFIDENTIAL

Ballistic Test of Cool Propellants

(3) The black smoke observed during the subject tests appeared denser at the lower pressure levels. The smoke was similar in appearance for both the single and double-base non-picrite (DBP) propellants on flashless rounds with the exception of IX-29 (single-base) and IX-31 and IX-32 (double-base) which gave dark grey smoke. Flashing rounds, in general, produced brownish smoke although low intensity flashes were frequently accompanied by brown and black or brown and grey smoke.

(4) The percentage of flashless rounds (and hence rounds with black smoke) was greater on cool non-picrite (DBP) rounds fired with XC-D22/- primers, than on rounds fired with Mk 42-1 primers (with or without voids or boosters around the primer).

(5) There is no apparent correlation between the appearance of black smoke and ballistic regularity or the smoothness of the pressure-time curves.

(6) IHPB-S-83C, a single-base propellant (2123°K) without dinitrotoluene or dibutylphthalate gave no black smoke when tested with the Mk 42 or the XC-D22/250 primer. The majority of rounds with the XC-D22/250 primers were essentially flashless while all rounds, except those at low charge weight, with the Mk 42 primer gave large flashes. Smoke was light grey on flashless rounds and brownish on flashing rounds. As with picrite powders, strong ammonia fumes were evident on all rounds.

(7) Two hundred and eighteen (218) rounds of non-picrite powder fired under rapid fire conditions were not observed for smoke and flash and are omitted from the tabulations in Appendices (D) and (E).

e. Carbon Deposits:

(1) During single round firing in the subject tests, no mechanical difficulties were experienced by the formation of carbon. However, after 139 rapid fire rounds of Ex-6735 the gun jammed and could not be fired. An examination of the breech mechanism showed it to be covered with a layer of soot and all bearing surfaces to be free of any lubricant. Appendix (I) contains photographs of the breech mechanism after jamming. Apparently, the carbon deposition tended to "dry up" the lubricant and caused the moving parts to overheat and jam.

CONFIDENTIAL

NPG REPORT NO. 770

Ballistic Test of Cool Propellants

(2) The extent of carbon deposit, while not serious enough to cause mechanical difficulties in a few rounds of slow gun firing is greatly aggravated during extended rapid fire conditions. It is evident that the situation is not due to a few unusual rounds but to a cumulative effect as seen by the rapid fire tests.

(3) In order to proceed with the rapid fire wear trials, efforts were made to eliminate carbon deposition. The use of a scavenger NH powder SPDN-4438 (2621°K) at the base of the case and Ex-6735 (non-picrite 1883°K) powder on top proved satisfactory in that, while there was no apparent reduction of black smoke, there was essentially complete elimination of carbon deposition at the gun breech. Detailed results are given in Appendix (H).

(4) Appendix (E) shows the amount of carbon (based on Ex-6735 as 100%) observed in the barrel and chamber for various powders. The carbon deposits were cleaned out of the gun with compressed air after every round. Appendix (G) shows photographs of the carbon remaining in the fired cases for the various powders. Various blends of NH powder NPFB-266 (2588°K) and Ex-6735 (1883°K) gave little reduction in black smoke, and decreases in carbon deposits only in proportion to the decrease in the amount of the cool powder used. Unless the critical powder flame temperature for carbon formation is around 2500°K this indicates that the carbon formation is due to the initial reactions at the surface of the powder and not the final gas phase reactions which would otherwise have been altered by the introduction of the hotter NH powder with complete elimination of carbon. Although no carbon deposit was observed for IX-29 (single-base 2243°K), it was observed for Ex-6705 (single-base 2186°K). This may indicate that the critical powder flame temperature is around 2200°K . However, it should be noted that IX-29 contains ethyl centralite as stabilizer and only 6.26% DBP while Ex-6705 contains DPA as stabilizer and 8.53% DBP. It is likely that DBP is responsible for the carbon formation since IHFB-S-83C which contains no DBP, but a rather high percentage of ethyl centralite (7.00%), produced no carbon although the flame temperature was only 2123°K . Although the estimate of approximately 2200°K as the critical temperature for the single-base powders containing DBP is subject to question because of the presence of ethyl centralite in the hotter powder, it is somewhat substantiated by the behavior of the IX and Ex double-base powders which differ in flame temperature only as a result of percentage differences in composition. Appendix (E) indicates a considerable decrease in carbon deposits for the double-base powders in going from 2025°K to 2170°K .

CONFIDENTIAL

NPG REPORT NO. 770

Ballistic Test of Cool Propellants

(5) There is no apparent correlation between the formation of carbon and ballistic regularity or the smoothness of the pressure-time curves.

f. VT Fuze Performance:

Appendix (J) gives in detail the fuze performance data obtained on programs fired using a scavenger NH powder at the base of the case and Ex-6735 on top with the XC-D22/250 primer. No carbon deposits were observed after any of the rounds. An acceptable score of 64% effective was obtained on the fuze tests.

PART D

CONCLUSIONS

9. From the results of the subject tests, it is concluded that:

a. Ex-6721 was too fast for the 3"/70 large chamber gun and too slow for use in the 3"/50 caliber gun.

b. Ex-6735 was ballistically suitable for use in the 3"/50 caliber gun with the XC-D22/250 primer. The pressure-time records obtained with the Mk 42 primer plus 2 empty pyralin containers were fairly smooth while those obtained with all other ignition systems had slight steps in the pressure-rise section of the curves.

c. IHPB-S-83C with the XC-D22/250 primer was too slow for use in the 3"/50 caliber gun but was ballistically satisfactory with the Mk 42 primer. The pressure-time curve obtained with IHPB-S-83C and XC-D22/250 primer had a slight step in the pressure-rise section but was much better than the ones obtained with IHPB-S-83C using the Mark 42 primer and with NPEB-223 using IHPB-S-83C. No carbon deposits were obtained with IHPB-S-83C.

d. Ex-6735 with the XC-D22/250 primer gave as much or more black smoke than the other non-picrite powders at service charge with the exception of Ex-6721 which produced slightly denser smoke.

CONFIDENTIAL

CONFIDENTIAL

NPG REPORT NO. 770

Ballistic Test of Cool Propellants

e. The smoke was similar in appearance (i.e. black) for both single and double-base cool non-picrite (DBP) propellants on flashless rounds, with the exception of IX-29 (single-base) and IX-31 and IX-32 (double-base) which gave dark grey smoke. Flashing rounds in general produced brownish smoke although low intensity flashes were frequently accompanied by brown and black or brown and grey smoke.

f. A relationship exists between the amount of black smoke produced and the ignition systems used with cool non-picrite (DBP) powders and is dependent on the occurrence or non-occurrence of flash. Carbon deposition was only slightly affected by changes in ignition.

g. There is no apparent correlation between the appearance of black smoke and carbon deposits produced with non-picrite propellants and ballistic regularity or the smoothness of the pressure-time curves.

h. The extent of carbon deposition, while not serious enough to cause mechanical difficulties in a few rounds of slow gun firings, is greatly aggravated during extended rapid fire conditions. It is evident that the carbon deposits causing gun operating failure are not due to a few unusual rounds but to a cumulative effect.

* Black Smoke

** Based on Ex-6735 as giving 100% carbon deposit.

Carbonaceous deposit in barrel and chamber on all rounds except 1 to 4 incl. Cleaned out with compressed air after each round.

Powder A - Blend of NPFB-266 (3.22 lbs.) and Ex-6735 (0.98 lbs.)
 Powder B - Blend of NPFB-266 (2.01 lbs.) and Ex-6735 (2.45 lbs.)

A = Primer

B = No. of rounds fired

C = No. of rounds black smoke

D = No. of rounds firing

E = Percentage of rounds

giving black smoke

(e) Plus 150 grams of EX-7215 in pyralin container around forward end of primer.

(f) Plus 2 empty pyralin containers end-around primer.

(g) Dark grey smoke

10

A right-angled triangle ruler is shown, oriented with its hypotenuse sloping downwards from left to right. The angle at the bottom-left vertex is marked with a square symbol, indicating it is a right angle. The two legs of the triangle are labeled with the letters 'a' and 'b'. The hypotenuse is labeled with the letter 'c'.

		Ex-6735	4.41	928	175

- (a) Rapid fire test of Ex-6735 gave accumulation of carbon deposit around breech mechanism resulting in breechblock jamming open.
- (b) Test of scavenger NH powder on bottom of case and non-picrite cool powder on top gave a small amount of soot on breech mechanism with some drying of lubricants.
- (c) Comparison tests of a scavenger NH powder on bottom of case with non-picrite cool powder on top versus an NH powder alone showed no perceptible difference in appearance of breech mechanism.
- (d) A scavenger NH powder on bottom of case and non-picrite cool powder on top gave no carbon formation and no mechanical difficulty in rapid fire and fuze tests.
- (e) A scavenger NH powder on bottom of case and non-picrite cool powder on top gave no carbon formation and no mechanical difficulty in rapid fire tests. Black smoke observed on 13 flashless rounds of the first 25 round burst. Flashing rounds gave both black and brown smoke. Second burst gave 9 flashless rounds, third burst gave 2, fourth burst gave 3, and the remaining three 25 round bursts gave all flashing rounds with brown smoke only.
